AMENDMENTS TO THE CLAIMS:

1. (Currently Amended) A dental instrument having a drive tool and a transmission device with at least one magnetic and/or magnetizable clutch element, each at least one said clutch element having an air gap and a flux guide coil, the instrument comprising:

a means for influencing the transmission torque of the magnetic and/or magnetizable clutch element; and

a means for modifying the flux guide coil of the magnetic and/or magnetizable clutch element, said means for modifying being a magnetically soft part.

- 2. (Withdrawn) The dental instrument according to claim 1, further comprising: a means for modifying the air gap of the clutch element.
- 3. (Currently Amended) The dental instrument according to claim 1, further comprising wherein:

a means for modifying the flux guide coil of the magnetic clutch element said means for modifying being made of a magnetically conductive material in form of a sleeve.

- 4. (Currently Amended) The dental instrument according to claim 3, wherein:

 the means for modifying the flux guide coil said sleeve is positioned in the a zone of influence of one or more clutch elements.
 - 5. (Withdrawn) The dental instrument according to claim 3, wherein: the means for modifying the flux guide coil is an electromagnet.
 - 6. (Withdrawn) The dental instrument according to claim 5, wherein: the magnetic force of the electromagnet is controlled according to service parameters.

ATTORNEY DOCKET NO.: 066489-0012

Application No.: 10/003,293

7. (Withdrawn) The dental instrument according to claim 5, wherein: the flux guide coil is indirectly modified by stationary magnets.

- 8. (Withdrawn) The dental instrument according to claim 5, wherein: the flux guide coil is directly modified by moving magnets, and the moving magnets transfer the torque with respect to the magnetic force.
- 9. (Withdrawn) The dental instrument according to claim 4, further comprising:
 a softly magnetized part,
 the low retentive part is only effective in a subzone of the magnetic clutch element.
- 10. (Currently Amended) The dental instrument according to claim 4, wherein: switching means are provided that cooperate with the magnetic clutch element and the low retentive magnetically soft part.
- 11. (Currently Amended) The dental instrument according to claim 1, wherein:
 the magnetic clutch elements are element is chosen in such a manner, that after the
 declutching of the magnetic clutch elements element a force is created, which is opposite to the
 an original working direction, by means of which the tool can be moved into the opposite
 direction.
 - 12. (Currently Amended) The dental instrument according to claim 1, further comprising: a neck drive as said transmission device;
 - a drive motor with high rotation speed; and
- a reduction gear for reducing the rotation speeds in a zone between 5 and 25 rotations/sec. (300 to 2100 rotations/minute).

ATTORNEY DOCKET NO.: 066489-0012

Application No.: 10/003,293

Page 7

13. (Currently Amended) The dental instrument according to claim 1, wherein:
the drive tool can be loaded with torsion up to a threshold value; and
the transmitting transmission device is formed with the magnetic clutch element so that
the threshold value of the drive tool is never reached.

- 14. (Original) The dental instrument according to claim 1, further comprising: a tool for root canal treatment.
- 15. (Original) The dental instrument according to claim 1, wherein:
 the magnetic clutch element is arranged so that rotations are transmitted on an input side and on an output side.
- 16. (Withdrawn) The dental instrument according to claim 1, wherein:
 the magnetic clutch element is arranged such that a part of the clutch performs a rotation,
 and the other part of the clutch performs a translation.
 - 17. (Withdrawn) The dental instrument according to claim 1, wherein: both magnetic clutch elements perform translations.
- 18. (Original) The dental instrument according claim 1, wherein:
 a connection point is provided on a motor,
 said connection point corresponds to the connection point of a tool working with a high rotation speed.
